Decision responsibility by beneficiary - Experiment 2 (others' responsibility)

**Description**  (/registries/drafts/5ec3cc39d89d6700f273bc6c/metadata#description)

Do we think others are more responsible for decisions when that person rather than someone else benefits from the outcome?

We asked people for feelings of responsibility ratings after they had contributed to the minority/majority decision of which of two gambles to choose, and that gamble had paid out no/reward to the participant/another player.

Participants showed a strong tendency to provide higher ratings if they received the outcome and if the outcome was a reward. Moreover, participants tended to provide higher ratings for rewarded vs non-rewarded trials where they were in the majority or where they were receiving the outcome. Finally, there was a three-way interaction: the difference in responsibility for rewarded vs non-rewarded trials according to whether the participant received the outcome was only present where the participants' gamble selections were selected by majority vote. ([https://mjaquiere.github.io/responsibility-by-reward/analysis/2020-05-08\\_main-analysis.html](https://mjaquiere.github.io/responsibility-by-reward/analysis/2020-05-08_main-analysis.html))

We want to test whether similar results will be obtained when asking participants to rate another person's responsibility rather than their own.
